

Login & verification flow feels inconsistent

- I registered and verified my phone earlier (Nov 19), but when I came back, the platform asked me to go through phone verification and the full identity form again.

Sometimes it loads the KYC form, sometimes it doesn't.

Wallet creation is blocked

- When creating a new wallet I get "Phone number verification failed"
- My phone was already verified, and the wallet screen has no way to re-enter or fix the number.
- This makes it impossible to complete the wallet flow.

Account/session behaviour is unstable

- Sometimes I get logged out, sometimes it asks for verification again,
- Other times it logs me straight into the old account I created on Nov 19.

Feels like the session state isn't saving consistently

UI/UX notes

- The dashboard looks clean and simple.
- Navigation is easy once inside.
- Verification steps could be more clear and consistent.

I'm ready and available to test next steps. Thanks
